CERTIFICATE OF INDEPENDENT BID DETERMINATION

1 This Form “E” must form part of all bids¹ invited.

2 Section 4 (1) (b) (iii) of the Competition Act No. 89 of 1998, as amended, prohibits an agreement between, or concerted practice by, firms, or a decision by an association of firms, if it is between parties in a horizontal relationship and if it involves collusive bidding (or bid rigging).² Collusive bidding is a pe se prohibition meaning that it cannot be justified under any grounds.

3 Municipal Supply Chain Management Regulation 38 (1) prescribes that a supply chain management policy must provide measures for the combating of abuse of the supply chain management system, and must enable the accounting officer, among others, to:
   a. take all reasonable steps to prevent such abuse;
   b. reject the bid of any bidder if that bidder or any of its directors has abused the supply chain management system of the municipality or municipal entity or has committed any improper conduct in relation to such system; and
   c. cancel a contract awarded to a person if the person committed any corrupt or fraudulent act during the bidding process or the execution of the contract.

4 This Form “E” serves as a certificate of declaration that would be used by institutions to ensure that, when bids are considered, reasonable steps are taken to prevent any form of bid-rigging.

5 In order to give effect to the above, the attached Certificate of Bid Determination (Form “E”) must be completed and submitted with the bid:

¹ Includes price quotations, advertised competitive bids, limited bids and proposals.

² Bid rigging (or collusive bidding) occurs when businesses, that would otherwise be expected to compete, secretly conspire to raise prices or lower the quality of goods and / or services for purchasers who wish to acquire goods and / or services through a bidding process. Bid rigging is, therefore, an agreement between competitors not to compete.

**Network Configuration**

Typical configuration for Wi-Fi Broadband Service is shown in the diagram below.

The network is divided into 3 parts:
- Outdoor coverage
- Indoor coverage
- Data Centre
Existing Wi-Fi Network Overview

For the access portion of the network two devices work with each other to serve an SSID on site, these two devices are the Access Point (AP5510 for indoor and AP6610 for outdoor) they get their configuration from an Access Controller (AC6605) situated in Teraco. Each AP hosts two SSID’s, namely Ekurhuleni Free Wifi and EMM Staff, both have an access control mechanism in the form of a landing page. Users connected to the free Wi-Fi SSID submits their MAC address via the landing page and the rest of the core checks if there is still data available for this user and so allows the user onto the network or rejects him. For the EMM Staff SSID, users use their COE AD credentials and so get access to COE’s internal network.

Once a user is connected to the network on either SSID they are given an IP on a user VLAN, this VLAN is unique per AC pair and per SSID. Each AC in the core is paired with another, this allows for failover. If one AC goes down its paired AC will take over the management of its AP’s. The AC’s are connected to the AP’s and the rest of the core via the EMM network.

The AAA functionality of the network is realized with the use of two Mikrotik Routers (One for each SSID) and a RADIUS server. The Mikrotik Routers hosts the landing page for each SSID and acts as the supplicant of user information to the AAA server. The AAA server authenticates users based on the VLAN and SSID that they connected
to, for the EMM staff it simply submits the credentials to the EMM AD and based on the response it allows a user onto
the network, for the Free Wifi it checks its internal usage database if the user has reached his cap or not and so
allows a user on the network. Each Mikrotik router and each server has a HA paired router to allow for failover, this
means 4 routers and 2 servers total.

The last component of the WIFI core is the e-sight server. It is an NMS that manages all the equipment in the core using
SNMPv3. Alarm reporting, traffic reporting and maintenance is handle by the e-sight. It is implemented in an HA pair
meaning that there is one eSight server in each core.

**SPECIFICATIONS**

New equipment must be able to integrate with current infrastructure, Wi-Fi equipment and current eSight NMS (Version
3.2).

All current equipment must be maintained and supported. The current network consists of Huawei Access Points for
the access layer of the Wi-Fi network, Indoor and Outdoor. They are managed by Huawei Access controllers. Internal
Wi-Fi System is AAA/RADIUS (Mikrotik) server which is the interface between the Wi-Fi access portion of the network
and the COE Active Directory. It is expected of a successful bidder to maintain current Huawei Indoor and Outdoor
Access Points.

802.1x is used to authenticate users with the AD. COE requirement is a Centralized Wi-Fi NMS with redundant solution,
this network provides a Web-Based centralized console (GUI)

All new equipment to be installed must be ICASA type approved.
All site survey requirements are to be covered equipment pricing.
